## ***1 Global Complex Types***

## 1.1 CutName

### 1.1.1 Description:

Allows for an expiryDateTime cut to be described by name.

### 1.1.2 Contents:

Inherited element(s): (This definition inherits the content defined by the type xsd:normalizedString)

- 

### 1.1.3 Used by:

- Complex type: ExpiryDateTime

### 1.1.4 Derived Types:

### 1.1.5 Figure:

### 1.1.6 Schema Fragment:

```
<xsd:complexType name="CutName">
  <xsd:annotation>
    <xsd:documentation xml:lang="en">
      Allows for an expiryDateTime cut to be described by name.
    </xsd:documentation>
  </xsd:annotation>
  <xsd:simpleContent>
    <xsd:extension base="xsd:normalizedString">
      <xsd:attribute name="cutNameScheme" type="xsd:anyURI" default="http://www.fpml.org/coding
    </xsd:extension>
  </xsd:simpleContent>
</xsd:complexType>
```

## 1.2 ExchangeRate

### 1.2.1 Description:

A type that is used for describing the exchange rate for a particular transaction.

### 1.2.2 Contents:

Inherited element(s): (This definition inherits the content defined by the type FxRate)

- A type describing the rate of a currency conversion: pair of currency, quotation mode and exchange rate.

**spotRate** (zero or one occurrence; of the type xsd:decimal) An optional element used for FX forwards and certain types of FX OTC options. For deals consumated in the FX Forwards Market, this represents the current market rate for a particular currency pair. For barrier and digital/binary options, it can be useful to include the spot rate at the time the option was executed to make it easier to know whether the option needs to move "up" or "down" to be triggered.

**forwardPoints** (zero or one occurrence; of the type xsd:decimal) An optional element used for deals consumated in the FX Forwards market. Forward points represent the interest rate differential between the two currencies traded and are quoted as a premium or a discount. Forward points are added to, or subtracted from, the spot rate to create the rate of the forward trade.

**sideRates** (zero or one occurrence; of the type SideRates) An optional element that allow for definition of rates against base currency for non-base currency FX contracts.

### 1.2.3 Used by:

- Complex type: FxLeg

### 1.2.4 Derived Types:

### 1.2.5 Figure:

### 1.2.6 Schema Fragment:

```
<xsd:complexType name="ExchangeRate">
  <xsd:annotation>
    <xsd:documentation xml:lang="en">

</xsd:complexType>
```

## 1.3 ExpiryDateTime

### 1.3.1 Description:

A type that describes the date and time in a location of the option expiry. In the case of American options this is the latest possible expiry date and time.

### 1.3.2 Contents:

**expiryDate** (exactly one occurrence; of the type `xsd:date`) Represents a standard expiry date as defined for an FX OTC option.

**expiryTime** (exactly one occurrence; of the type `BusinessCenterTime`)

**cutName** (zero or one occurrence; of the type `CutName`)

### 1.3.3 Used by:

- Complex type: `FxAverageRateOption`
- Complex type: `FxDigitalOption`
- Complex type: `FxOptionLeg`

### 1.3.4 Derived Types:

### 1.3.5 Figure:

### 1.3.6 Schema Fragment:

```
<xsd:complexType name="ExpiryDateTime">
  <xsd:annotation>
    <xsd:documentation xml:lang="en">
      A type that describes the date and time in a location of the
      option expiry. In the case of American options this is the latest

        </xsd:documentation>
      </xsd:annotation>
    </xsd:element>
    <xsd:element name="expiryTime" type="BusinessCenterTime"/>
    <xsd:element name="cutName" type="CutName" minOccurs="0"/>
  </xsd:sequence>
</xsd:complexType>
```

## 1.4 FxAmericanTrigger

### 1.4.1 Description:

A type that defines a particular type of payout in an FX OTC exotic option. An American trigger occurs if the trigger criteria are met at any time from the initiation to the maturity of the option.

### 1.4.2 Contents:

**touchCondition** (exactly one occurrence; of the type TouchConditionEnum) The binary condition that applies to an American-style trigger. There can only be two domain values for this element: "touch" or "no touch".

**quotedCurrencyPair** (exactly one occurrence; of the type QuotedCurrencyPair) Defines the two currencies for an FX trade and the quotation relationship between the two currencies.

**triggerRate** (exactly one occurrence; of the type xsd:decimal) The market rate is observed relative to the trigger rate, and if it is found to be on the predefined side of (above or below) the trigger rate, a trigger event is deemed to have occurred.

**informationSource** (one or more occurrences; of the type InformationSource) The information source where a published or displayed market rate will be obtained, e.g. Telerate Page 3750.

**observationStartDate** (zero or one occurrence; of the type xsd:date) The start of the period over which observations are made to determine whether a trigger has occurred.

**observationEndDate** (zero or one occurrence; of the type xsd:date) The end of the period over which observations are made to determine whether a trigger event has occurred.

### 1.4.3 Used by:

- Complex type: FxDigitalOption

### 1.4.4 Derived Types:

### 1.4.5 Figure:

### 1.4.6 Schema Fragment:

```
<xsd:complexType name="FxAmericanTrigger">
  <xsd:annotation>
    <xsd:documentation xml:lang="en">
      A type that defines a particular type of payout in an FX OTC

  </xsd:annotation>
</xsd:element>
</xsd:sequence>
</xsd:complexType>
```

## 1.5 FxAverageRateObservationDate

### 1.5.1 Description:

A type that, for average rate options, is used to describe each specific observation date, as opposed to a parametric frequency of rate observations.

### 1.5.2 Contents:

**observationDate** (exactly one occurrence; of the type xsd:date) A specific date for which an observation against a particular rate will be made and will be used for subsequent computations.

**averageRateWeightingFactor** (exactly one occurrence; of the type xsd:decimal) An optional factor that can be used for weighting certain observation dates. Typically, firms will weight each date with a factor of 1 if there are standard, unweighted adjustments.

### 1.5.3 Used by:

- Complex type: FxAverageRateOption

### 1.5.4 Derived Types:

### 1.5.5 Figure:

### 1.5.6 Schema Fragment:

```
<xsd:complexType name="FxAverageRateObservationDate">
  <xsd:annotation>
    <xsd:documentation xml:lang="en">

    </xsd:element>
  </xsd:sequence>
</xsd:complexType>
```

## 1.6 FxAverageRateObservationSchedule

### 1.6.1 Description:

A type that describes average rate options rate observations. This is used to describe a parametric frequency of rate observations against a particular rate. Typical frequencies might include daily, every Friday, etc.

### 1.6.2 Contents:

**observationStartDate** (exactly one occurrence; of the type xsd:date) The start of the period over which observations are made to determine whether a trigger has occurred.

**observationEndDate** (exactly one occurrence; of the type xsd:date) The end of the period over which observations are made to determine whether a trigger event has occurred.

**calculationPeriodFrequency** (exactly one occurrence; of the type CalculationPeriodFrequency) The frequency at which calculation period end dates occur with the regular part of the calculation period schedule and their roll date convention.

### 1.6.3 Used by:

- Complex type: FxAverageRateOption

### 1.6.4 Derived Types:

### 1.6.5 Figure:

### 1.6.6 Schema Fragment:

## 1.7 FxAverageRateOption

### 1.7.1 Description:

A type that is used for an option whose payout is based on the average of the price of the underlying over a specific period of time. The payout is the difference between the predetermined, fixed strike price and the average of spot rates observed and is used for hedging against prevailing spot rates over a given time period.

### 1.7.2 Contents:

Inherited element(s): (This definition inherits the content defined by the type Product)

- The base type which all FpML products extend.

**buyerPartyReference** (exactly one occurrence; of the type PartyOrTradeSideReference) A reference to the party that buys this instrument, ie. pays for this instrument and receives the rights defined by it. See 2000 ISDA definitions Article 11.1 (b). In the case of FRAs this the fixed rate payer.

**sellerPartyReference** (exactly one occurrence; of the type PartyOrTradeSideReference) A reference to the party that sells ("writes") this instrument, i.e. that grants the rights defined by this instrument and in return receives a payment for it. See 2000 ISDA definitions Article 11.1 (a). In the case of FRAs this is the floating rate payer.

**expiryDateTime** (exactly one occurrence; of the type ExpiryDateTime) The date and time in a location of the option expiry. In the case of american options this is the latest possible expiry date and time.

**exerciseStyle** (exactly one occurrence; of the type ExerciseStyleEnum) The manner in which the option can be exercised.

**fxOptionPremium** (zero or more occurrences; of the type FxOptionPremium) Premium amount or premium installment amount for an option.

**valueDate** (exactly one occurrence; of the type xsd:date) The date on which both currencies traded will settle.

**putCurrencyAmount** (exactly one occurrence; of the type Money) The currency amount that the option gives the right to sell.

**callCurrencyAmount** (exactly one occurrence; of the type Money) The currency amount that the option gives the right to buy.

**fxStrikePrice** (exactly one occurrence; of the type FxStrikePrice) TBA

**spotRate** (zero or one occurrence; of the type xsd:decimal) An optional element used for FX forwards and certain types of FX OTC options. For deals consummated in the FX Forwards Market, this represents the current market rate for a particular currency pair. For barrier and digital/binary options, it can be useful to include the spot rate at the time the option was executed to make it easier to know whether the option needs to move "up" or "down" to be triggered.

**payoutCurrency** (exactly one occurrence; of the type Currency) The ISO code of the currency in which a payout (if any) is to be made when a trigger is hit on a digital or barrier option.

**averageRateQuoteBasis** (exactly one occurrence; of the type StrikeQuoteBasisEnum) The method by which the average rate that is being observed is quoted.

**precision** (zero or one occurrence; of the type xsd:nonNegativeInteger) Specifies the rounding precision in terms of a number of decimal places. Note how a percentage rate rounding of 5 decimal places is expressed as a rounding precision of 7 in the FpML document since the percentage is expressed as a decimal, e.g. 9.876543% (or 0.09876543) being rounded to the nearest 5 decimal places is 9.87654% (or 0.0987654).

**payoutFormula** (zero or one occurrence; of the type xsd:string) The description of the mathematical computation for how the payout is computed.

**primaryRateSource** (exactly one occurrence; of the type InformationSource) The primary source for where the rate observation will occur. Will typically be either a page or a reference bank published rate.

**secondaryRateSource** (zero or one occurrence; of the type InformationSource) An alternative, or secondary, source for where the rate observation will occur. Will typically be either a page or a reference bank published rate.

**fixingTime** (exactly one occurrence; of the type BusinessCenterTime) The time at which the spot currency exchange rate will be observed. It is specified as a time in a specific business center, e.g. 11:00am London time.

Either

**averageRateObservationSchedule** (exactly one occurrence; of the type FxAverageRateObservationSchedule) Parametric schedule of rate observations.

Or

**averageRateObservationDate** (one or more occurrences; of the type FxAverageRateObservationDate) One or more specific rate observation dates.

**observedRates** (zero or more occurrences; of the type ObservedRates) Describes prior rate observations within average rate options. Periodically, an average rate option agreement will be struck whereby some rates have already been observed in the past but will become part of computation of the average rate of the option. This structure provides for these previously observed rates to be included in the description of the trade.

## 1.8 FxBarrier

### 1.8.1 Description:

A type that is used within the FX barrier option definition to define one or more barrier levels that determine whether the option will be knocked-in or knocked-out.

### 1.8.2 Contents:

**fxBarrierType** (zero or one occurrence; of the type FxBarrierTypeEnum) This specifies whether the option becomes effective ("knock-in") or is annulled ("knock-out") when the respective trigger event occurs.

**quotedCurrencyPair** (exactly one occurrence; of the type QuotedCurrencyPair) Defines the two currencies for an FX trade and the quotation relationship between the two currencies.

**triggerRate** (exactly one occurrence; of the type xsd:decimal) The market rate is observed relative to the trigger rate, and if it is found to be on the predefined side of (above or below) the trigger rate, a trigger event is deemed to have occurred.

**informationSource** (one or more occurrences; of the type InformationSource) The information source where a published or displayed market rate will be obtained, e.g. Telerate Page 3750.

**observationStartDate** (zero or one occurrence; of the type xsd:date) The start of the period over which observations are made to determine whether a trigger has occurred.

**observationEndDate** (zero or one occurrence; of the type xsd:date) The end of the period over which observations are made to determine whether a trigger event has occurred.

### 1.8.3 Used by:

</xsd:complexType>
```

## 1.9 FxBarrierOption

### 1.9.1 Description:

A type that describes an option with a put/call component, but also one or more associated barrier rates. If the market rate moves to reach a barrier rate a trigger event occurs. The trigger event may for example be necessary to enable the option, or may annul the option contract. [Since the barriers reduce the probability of exercise, the premium for an option with barriers is likely to be cheaper than one without].

### 1.9.2 Contents:

Inherited element(s): (This definition inherits the content defined by the type FxOptionLeg)

- A type that is used for describing a standard FX OTC option (European or American) which may be a complete trade in its own right or part of a trade strategy.

**spotRate** (zero or one occurrence; of the type xsd:decimal) An optional element used for FX forwards and certain types of FX OTC options. For deals consumated in the FX Forwards Market, this represents the current market rate for a particular currency pair. For barrier and digital/binary options, it can be useful to include the spot rate at the time the option was executed to make it easier to know whether the option needs to move "up" or "down" to be triggered.

**fxBarrier** (one or more occurrences; of the type FxBarrier) Information about a barrier rate in a Barrier Option - specifying the exact criteria for a trigger event to occur.

**triggerPayout** (zero or one occurrence; of the type FxOptionPayout) The amount of currency which becomes payable if and when a trigger event occurs.

### 1.9.3 Used by:

## 1.10 FxDigitalOption

### 1.10.1 Description:

A type that describes an option without a put/call component (and so no associated exercise), but with one or more trigger rates) Examples are "one-touch", "no-touch", and "double-no-touch" options. For a specified period the market rate is observed relative to the trigger rates, and on a trigger event a fixed payout may become due to the buyer of the option, or alternatively the option contract may be annulled.

### 1.10.2 Contents:

Inherited element(s): (This definition inherits the content defined by the type Product)

- The base type which all FpML products extend.

**buyerPartyReference** (exactly one occurrence; of the type PartyOrTradeSideReference) A reference to the party that buys this instrument, ie. pays for this instrument and receives the rights defined by it. See 2000 ISDA definitions Article 11.1 (b). In the case of FRAs this the fixed rate payer.

**sellerPartyReference** (exactly one occurrence; of the type PartyOrTradeSideReference) A reference to the party that sells ("writes") this instrument, i.e. that grants the rights defined by this instrument and in return receives a payment for it. See 2000 ISDA definitions Article 11.1 (a). In the case of FRAs this is the floating rate payer.

**expiryDateTime** (exactly one occurrence; of the type ExpiryDateTime) The date and time in a location of the option expiry. In the case of american options this is the latest possible expiry date and time.

**fxOptionPremium** (zero or more occurrences; of the type FxOptionPremium) Premium amount or premium installment amount for an option.

**valueDate** (exactly one occurrence; of the type xsd:date) The date on which both currencies traded will settle.

**quotedCurrencyPair** (exactly one occurrence; of the type QuotedCurrencyPair) Defines the two currencies for an FX trade and the quotation relationship between the two currencies.

**spotRate** (zero or one occurrence; of the type xsd:decimal) An optional element used for FX forwards and certain types of FX OTC options. For deals consummated in the FX Forwards Market, this represents the current market rate for a particular currency pair. For barrier and digital/binary options, it can be useful to include the spot rate at the time the option was executed to make it easier to know whether the option needs to move "up" or "down" to be triggered.

Either

**fxEuropeanTrigger** (one or more occurrences; of the type FxEuropeanTrigger) A European trigger occurs if the trigger criteria are met, but these are valid (and an observation is made) only at the maturity of the option.

Or

**fxAmericanTrigger** (one or more occurrences; of the type FxAmericanTrigger) An American trigger occurs if the trigger criteria are met at any time from the initiation to the maturity of the option.

**triggerPayout** (exactly one occurrence; of the type FxOptionPayout) The amount of currency which becomes payable if and when a trigger event occurs.

## 1.11 FxEuropeanTrigger

### 1.11.1 Description:

A type that defines a particular type of payout in an FX OTC exotic option. A European trigger occurs if the trigger criteria are met, but these are valid (and an observation is made) only at the maturity of the option.

### 1.11.2 Contents:

**triggerCondition** (exactly one occurrence; of the type TriggerConditionEnum) The binary condition that applies to a European-style trigger, determining where the spot rate must be relative to the triggerRate for the option to be exercisable. There can only be two domain values for this element: "aboveTrigger" or "belowTrigger".

**quotedCurrencyPair** (exactly one occurrence; of the type QuotedCurrencyPair) Defines the two currencies for an FX trade and the quotation relationship between the two currencies.

**triggerRate** (exactly one occurrence; of the type xsd:decimal) The market rate is observed relative to the trigger rate, and if it is found to be on the predefined side of (above or below) the trigger rate, a trigger event is deemed to have occurred.

**informationSource** (one or more occurrences; of the type InformationSource) The information source where a published or displayed market rate will be obtained, e.g. Telerate Page 3750.

### 1.11.3 Used by:

- Complex type: FxDigitalOption

## 1.12 FxLeg

### 1.12.1 Description:

A type that represents a single exchange of one currency for another. This is used for representing FX spot, forward, and swap transactions.

### 1.12.2 Contents:

Inherited element(s): (This definition inherits the content defined by the type Product)

- The base type which all FpML products extend.

**exchangedCurrency1** (exactly one occurrence; of the type Payment) This is the first of the two currency flows that define a single leg of a standard foreign exchange transaction.

**exchangedCurrency2** (exactly one occurrence; of the type Payment) This is the second of the two currency flows that define a single leg of a standard foreign exchange transaction.

Either

**valueDate** (exactly one occurrence; of the type xsd:date) The date on which both currencies traded will settle.

**exchangeRate** (exactly one occurrence; of the type ExchangeRate) The rate of exchange between the two currencies.

**nonDeliverableForward** (zero or one occurrence; of the type FxCashSettlement) Used to describe a particular type of FX forward transaction that is settled in a single currency.

**confirmationSenderPartyReference** (zero or one occurrence; of the type PartyReference) A reference to the party that is sending the current document as a confirmation of the trade.

## 1.13 FxOptionLeg

### 1.13.1 Description:

A type that is used for describing a standard FX OTC option (European or American) which may be a complete trade in its own right or part of a trade strategy.

### 1.13.2 Contents:

Inherited element(s): (This definition inherits the content defined by the type Product)

- The base type which all FpML products extend.

**buyerPartyReference** (exactly one occurrence; of the type PartyOrTradeSideReference) A reference to the party that buys this instrument, ie. pays for this instrument and receives the rights defined by it. See 2000 ISDA definitions Article 11.1 (b). In the case of FRAs this the fixed rate payer.

**sellerPartyReference** (exactly one occurrence; of the type PartyOrTradeSideReference) A reference to the party that sells ("writes") this instrument, i.e. that grants the rights defined by this instrument and in return receives a payment for it. See 2000 ISDA definitions Article 11.1 (a). In the case of FRAs this is the floating rate payer.

**expiryDateTime** (exactly one occurrence; of the type ExpiryDateTime) The date and time in a location of the option expiry. In the case of american options this is the latest possible expiry date and time.

**exerciseStyle** (exactly one occurrence; of the type ExerciseStyleEnum) The manner in which the option can be exercised.

**fxOptionPremium** (zero or more occurrences; of the type FxOptionPremium) Premium amount or premium installment amount for an option.

**valueDate** (exactly one occurrence; of the type xsd:date) The date on which both currencies traded will settle.

**cashSettlementTerms** (zero or one occurrence; of the type FxCashSettlement) This optional element is only used if an option has been specified at execution time to be settled into a single cash payment. This would be used for a non-deliverable option.

**putCurrencyAmount** (exactly one occurrence; of the type Money) The currency amount that the option gives the right to sell.

**callCurrencyAmount** (exactly one occurrence; of the type Money) The currency amount that the option gives the right to buy.

**fxStrikePrice** (exactly one occurrence; of the type FxStrikePrice) TBA

**quotedAs** (zero or one occurrence; of the type QuotedAs) Describes how the option was quoted.

## 1.14 FxOptionPayout

### 1.14.1 Description:

A type that contains full details of a predefined fixed payout which may occur (or not) in a Barrier Option or Digital Option when a trigger event occurs (or not).

### 1.14.2 Contents:

Inherited element(s): (This definition inherits the content defined by the type Money)

- A type defining a currency amount.

**payoutStyle** (exactly one occurrence; of the type PayoutEnum) The trigger event and payout may be asynchronous. A payout may become due on the trigger event, or the payout may (by agreement at initiation) be deferred (for example) to the maturity date.

**settlementInformation** (zero or one occurrence; of the type SettlementInformation) The information required to settle a currency payment that results from a trade.

### 1.14.3 Used by:

- Complex type: FxBarrierOption
- Complex type: FxDigitalOption

### 1.14.4 Derived Types:

### 1.14.5 Figure:

      </xsd:sequence>
    </xsd:extension>
  </xsd:complexContent>
</xsd:complexType>
```

## 1.15 FxOptionPremium

### 1.15.1 Description:

A type that specifies the premium exchanged for a single option trade or option strategy.

### 1.15.2 Contents:

**payerPartyReference** (exactly one occurrence; of the type PartyOrAccountReference) A reference to the party responsible for making the payments defined by this structure.

**receiverPartyReference** (exactly one occurrence; of the type PartyOrAccountReference) A reference to the party that receives the payments corresponding to this structure.

**premiumAmount** (exactly one occurrence; of the type Money) The specific currency and amount of the option premium.

**premiumSettlementDate** (exactly one occurrence; of the type xsd:date) The agreed-upon date when the option premium will be settled.

**settlementInformation** (zero or one occurrence; of the type SettlementInformation) The information required to settle a currency payment that results from a trade.

**premiumQuote** (zero or one occurrence; of the type PremiumQuote) This is the option premium as quoted. It is expected to be consistent with the premiumAmount and is for information only.

### 1.15.3 Used by:

      </xsd:annotation>
    </xsd:element>
  </xsd:sequence>
</xsd:complexType>
```

## 1.17 FxSwap

### 1.17.1 Description:

A type that describes an FX swap. This is similar to FpML\_FXLeg, but contains multiple legs for a particular trade.

### 1.17.2 Contents:

Inherited element(s): (This definition inherits the content defined by the type Product)

- The base type which all FpML products extend.

**fxSingleLeg** (one or more occurrences; of the type FxLeg) A single-legged FX transaction definition (e.g., spot or forward).

### 1.17.3 Used by:

- Element: fxSwap

### 1.17.4 Derived Types:

### 1.17.5 Figure:

### 1.17.6 Schema Fragment:

```
<xsd:complexType name="FxSwap">
  <xsd:annotation>
    <xsd:documentation xml:lang="en">

    <xsd:extension base="Product">
      <xsd:sequence>
        <xsd:element ref="fxSingleLeg" maxOccurs="unbounded"/>
      </xsd:sequence>
    </xsd:extension>
  </xsd:complexContent>
</xsd:complexType>
```

## 1.18 ObservedRates

### 1.18.1 Description:

A type that describes prior rate observations within average rate options. Periodically, an average rate option agreement will be struck whereby some rates have already been observed in the past but will become part of computation of the average rate of the option. This structure provides for these previously observed rates to be included in the description of the trade.

### 1.18.2 Contents:

**observationDate** (exactly one occurrence; of the type xsd:date) A specific date for which an observation against a particular rate will be made and will be used for subsequent computations.

**observedRate** (exactly one occurrence; of the type xsd:decimal) The actual observed rate before any required rate treatment is applied, e.g. before converting a rate quoted on a discount basis to an equivalent yield. An observed rate of 5% would be represented as 0.05.

### 1.18.3 Used by:

- Complex type: FxAverageRateOption

### 1.18.4 Derived Types:

### 1.18.5 Figure:

### 1.18.6 Schema Fragment:

```
<xsd:complexType name="ObservedRates">

## 1.19 PremiumQuote

### 1.19.1 Description:

A type that describes the option premium as quoted.

### 1.19.2 Contents:

**premiumValue** (exactly one occurrence; of the type xsd:decimal) The value of the premium quote. In general this will be either a percentage or an explicit amount.

**premiumQuoteBasis** (exactly one occurrence; of the type PremiumQuoteBasisEnum) The method by which the option premium was quoted.

### 1.19.3 Used by:

- Complex type: FxOptionPremium

### 1.19.4 Derived Types:

### 1.19.5 Figure:

### 1.19.6 Schema Fragment:

      </xsd:annotation>
    </xsd:element>
  </xsd:sequence>
</xsd:complexType>
```

## 1.20 QuotedAs

### 1.20.1 Description:

A type that describes how the option was quoted.

### 1.20.2 Contents:

**optionOnCurrency** (exactly one occurrence; of the type Currency) Either the callCurrencyAmount or the putCurrencyAmount defined elsewhere in the document. The currency reference denotes the option currency as the option was quoted (as opposed to the face currency).

**faceOnCurrency** (exactly one occurrence; of the type Currency) Either the callCurrencyAmount or the putCurrencyAmount defined elsewhere in the document. The currency reference denotes the face currency as the option was quoted (as opposed to the option currency).

**quotedTenor** (zero or one occurrence; of the type Interval) Code denoting the tenor of the option leg.

### 1.20.3 Used by:

- Complex type: FxOptionLeg

### 1.20.4 Derived Types:

### 1.20.5 Figure:

### 1.20.6 Schema Fragment:

```
<xsd:complexType name="QuotedAs">
  <xsd:annotation>
    <xsd:documentation xml:lang="en">

    </xsd:element>
  </xsd:sequence>
</xsd:complexType>
```

## 1.21 SideRate

### 1.21.1 Description:

A type that is used for describing a particular rate against base currency. Exists within SideRates.

### 1.21.2 Contents:

**currency** (exactly one occurrence; of the type Currency) The currency in which an amount is denominated.

**sideRateBasis** (exactly one occurrence; of the type SideRateBasisEnum) The method by which the exchange rate against base currency is quoted.

**rate** (exactly one occurrence; of the type xsd:decimal) The rate of exchange between the two currencies of the leg of a deal. Must be specified with a quote basis.

**spotRate** (zero or one occurrence; of the type xsd:decimal) An optional element used for FX forwards and certain types of FX OTC options. For deals consumated in the FX Forwards Market, this represents the current market rate for a particular currency pair. For barrier and digital/binary options, it can be useful to include the spot rate at the time the option was executed to make it easier to know whether the option needs to move "up" or "down" to be triggered.

**forwardPoints** (zero or one occurrence; of the type xsd:decimal) An optional element used for deals consumated in the FX Forwards market. Forward points represent the interest rate differential between the two currencies traded and are quoted as a premium or a discount. Forward points are added to, or subtracted from, the spot rate to create the rate of the forward trade.

### 1.21.3 Used by:

- Complex type: SideRates

### 1.21.4 Derived Types:

### 1.21.5 Figure:

### 1.21.6 Schema Fragment:

## 1.22 SideRates

### 1.22.1 Description:

A type that is used for including rates against base currency for non-base currency FX contracts.

### 1.22.2 Contents:

**baseCurrency** (exactly one occurrence; of the type Currency) The currency that is used as the basis for the side rates when calculating a cross rate.

**currency1SideRate** (zero or one occurrence; of the type SideRate) The exchange rate for the first currency of the trade against base currency.

**currency2SideRate** (zero or one occurrence; of the type SideRate) The exchange rate for the second currency of the trade against base currency.

### 1.22.3 Used by:

- Complex type: ExchangeRate

### 1.22.4 Derived Types:

### 1.22.5 Figure:

### 1.22.6 Schema Fragment:

```
<xsd:complexType name="SideRates">

  </xsd:sequence>
</xsd:complexType>
```

## 1.23 TermDeposit

### 1.23.1 Description:

A class defining the content model for a term deposit product.

### 1.23.2 Contents:

Inherited element(s): (This definition inherits the content defined by the type Product)

- The base type which all FpML products extend.

**initialPayerReference** (exactly one occurrence; of the type PartyReference) A pointer style reference to a party identifier defined elsewhere in the document. The party referenced is the payer of the initial principal of the deposit on the start date.

**initialReceiverReference** (exactly one occurrence; of the type PartyReference) A pointer style reference to a party identifier defined elsewhere in the document. The party is the receiver of the initial principal of the deposit on the start date.

**startDate** (exactly one occurrence; of the type xsd:date) The averaging period start date.

**maturityDate** (exactly one occurrence; of the type xsd:date) The end date of the calculation period. This date should already be adjusted for any applicable business day convention.

**dayCountFraction** (exactly one occurrence; of the type DayCountFraction) The day count fraction.

**principal** (exactly one occurrence; of the type Money) The principal amount of the trade.

**fixedRate** (exactly one occurrence; of the type xsd:decimal) The calculation period fixed rate. A per annum rate, expressed as a decimal. A fixed rate of 5% would be represented as 0.05.

**interest** (zero or one occurrence; of the type Money) The total interest of at maturity of the trade.

**payment** (zero or more occurrences; of the type Payment) A known payment between two parties.

## ***2 Global Elements***

## 2.1 fxAverageRateOption

### 2.1.1 Description:

A component describing an FX Average Rate Option product.

### 2.1.2 Contents:

Element fxAverageRateOption is defined by the complex type FxAverageRateOption

### 2.1.3 Used by:

### 2.1.4 Substituted by:

### 2.1.5 Figure:

### 2.1.6 Schema Fragment:

```
<xsd:element name="fxAverageRateOption" type="FxAverageRateOption" substitutionGroup="product">
  <xsd:annotation>
    <xsd:documentation xml:lang="en">
      A component describing an FX Average Rate Option product.
    </xsd:documentation>
  </xsd:annotation>
</xsd:element>
```

## 2.2 fxBarrierOption

### 2.2.1 Description:

A component describing a FX Barrier Option product.

### 2.2.2 Contents:

Element fxBarrierOption is defined by the complex type FxBarrierOption

### 2.2.3 Used by:

### 2.2.4 Substituted by:

### 2.2.5 Figure:
